Your Virtual Closet: Make Outfits, Save Outfits

Hannah Bang
MENTOR

Anjali Ahuja
Computer Science

Hannah Casali
Data Science/Biochemistry

Saachi Bhatia
Computer Science/ Philosophy

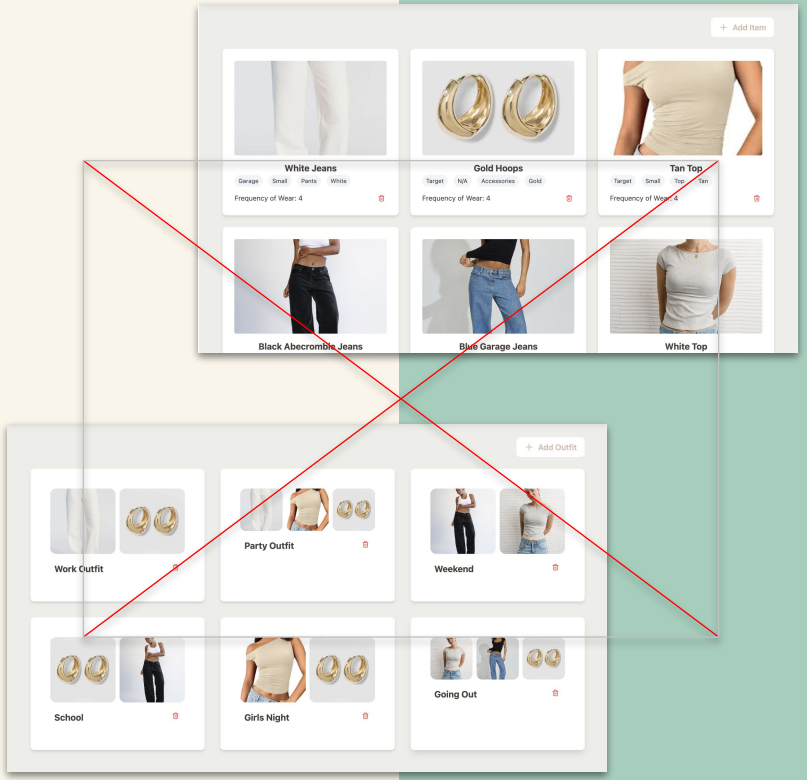
Payal Patel
Computer Science

We built ...

- A website that would model your physical closet
- You can add clothing items with just a URL
- You can also create outfits to plan for events

Why?

- Visualize matching items
- Can help clean out closet based on the amount of times you wear an a clothing item
- Tracks sizes / items in one place for easy shopping



How we built it

- Initially we struggled with using Git and version control. To overcome this we set up separate branches and communicated when and what we were pushing to the main branch more effectively
- Getting the API routes, JSON formats, and state updates to line up took trial and error. We built one small route at a time, tested it and reused that same pattern for the rest.

```jsx
import React, { useState } from 'react';
import { Plus } from 'lucide-react';
import { colors } from '../constants/colors';
import ItemsGrid from '../components/ItemsGrid';
import CreateItemModal from '../components/CreateItemModal';
import Header from '../components/Header';

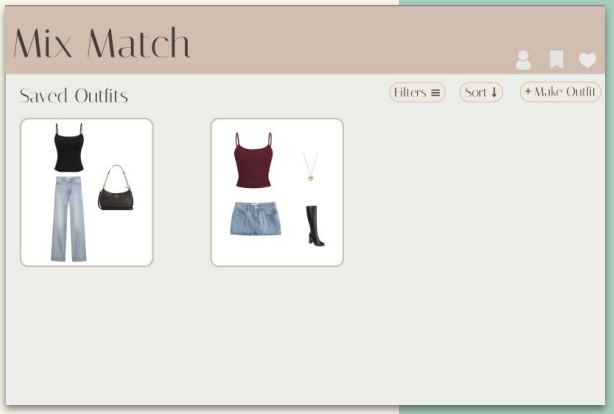
function MainPage({ items, onCreateItem, onDeleteItem}) {
  console.log(items);
  const [showCreateModal, setShowCreateModal] = useState(false);
  const [selectedItem, setSelectedItem] = useState(null);
  const [formData, setFormData] = useState({
    name: "",
    brand: "",
    category: "",
    size: "",
    color: "",
    image: "",
    frequency_of_wear: 0
  });

  const handleCreateItem = () => {
    if (!formData.name || !formData.brand || !formData.category
      || !formData.size || !formData.color
      || !formData.image || !formData.frequency_of_wear) {
      alert("Please fill in all boxes");
      return;
    }
```

```jsx
        <div className="flex gap-3">
          <span className="bg-gray-100 text-gray-700 px-2 py-1 rounded-full text-xs">
            {item.brand}
          </span>
          <span className="bg-gray-100 text-gray-700 px-2 py-1 rounded-full text-xs">
            {item.size}
          </span>
          <span className="bg-gray-100 text-gray-700 px-2 py-1 rounded-full text-xs">
            {item.category}
          </span>
          <span className="bg-gray-100 text-gray-700 px-2 py-1 rounded-full text-xs">
            {item.color}
          </span>
        </div>
        <div className="flex justify-between items-center mt-3 text-sm">
          <p className="text-sm text-left" style={{ color: colors.text }}>
            Frequency of Wear: {item.frequency_of_wear}
          </p>
          {onDelete && (
                <button
                  onClick={(e) => {
                    e.stopPropagation();
                    onDelete(item.id);
                  }}
                  className="text-red-500 hover:text-red-700 p-1"
                  title="Delete item"
                >
                  <Trash2 size={14} />
                </button>
              )}
```

Next Steps

- Filter / Sorting Options
- Edit Function on the Item / Outfit Card
- Login Pages
- Convert it to a social media platform (like Pinterest)
- More dynamic layout on the outfit cards
- Frequency of wear/Outfit log



What we learned

Payal Patel

I enjoyed creating the frontend design and connecting pages and components through various buttons.

Oasis taught me the key tactics to designing and building the different aspects of a functional frontend/backend. I also got to apply object oriented design skills to the structure of the project.

Anjali Ahuja

My favorite thing to work on was the design on the front end. I loved designing the header, and the outfit cards in the closet tab.

I learned about the many components that go into web development, as well as got a deeper understanding of the back end, because I have never worked with SupaBase before.

Hannah Casali

My favorite thing to work on was the backend Supabase/database development and creative brainstorming.

Through Oasis, I learned about what goes into web development and how to actually implement my ideas into code!

Saachi Bhatia

My favorite thing to work on was the creation of the database and connecting that to the front end.

In the process of creating this project, I learned what it takes to develop something from the ground up and how the different layers of web development fit together.
